RESEARCH ON SIMULATION-BASED
MULTI-OBJECTIVE BUSINESS
PROCESS OPTIMIZATION METHODS
USING EVOLUTIONARY INTELLIGENCE

Aleksandr Širaliov

October 2019

Abstract

Business process optimization (BPO) is the focus of all successful business companies. Various simulation optimization methods, which is understood as simulation-based optimization, are available. Optimization, itself, is known as the process of finding the best solution from all feasible solutions. It is not obviously clear which optimization method or group is most applicable for BPO. Simulation-based business process optimization is an instrument for detailed analysis of processes and further optimization. This paper discusses the simulation optimization methods for BPO.

Keywords: Simulation optimization, business process optimization, simulation software.

1 Introduction

Business process optimization (BPO) is the focus of all successful business companies. Various simulation optimization methods, which is understood as simulation-based optimization, are available. Optimization, itself, is known as the process of finding the best solution from all feasible solutions. It is not obviously clear which optimization method or group is most applicable for BPO. Simulation-based business process optimization is an instrument for detailed analysis of processes and further optimization. This paper discusses the simulation optimization methods for BPO. Different simulation optimization approaches have been provided in the related papers, however evolutionary algorithms and in specific genetic algorithms are widely used for BPO. Challenging in business process simulation becomes apparent when solving problems simultaneously against multiple objectives that conflict to each other. Multi-objective optimization involves optimizing a number of objectives simultaneously. To solve multi-objective optimization problems evolutionary algorithms are successfully used. One of the objectives of the paper is to provide sufficient information how simulation optimization and with which methods is used for BPO. In the field under discussion, it is a challenge to understand the relation between different terms, such as, Multi-objective optimization, Multi-criteria optimization, Business process optimization, Business process simulation, Simulation optimization, Evolutionary algorithms, Genetic algorithms. Due to large amount of the terms and in some case with very similar wording, is highly important to use them in proper and precisely way. For that reason, as next objectives of the paper, the explanations of such relations as well as meanings of terms are provided. The experiments with BPO, have been conducted with simulation optimization software, will be done and the results will be described in the paper. In our days, market is suggesting a lot of simulation optimization software and it becomes challenging to pick up the most suitable one. The brief comparison of simulation optimization software is also available in the paper. Some ideas how to prepare and run simulation-based multi-objective optimization method for BPO has been presented in the paper. In the end of the paper conclusions are listed and what assumptions might be addresses in the future studies. Nevertheless, it is necessary to continue research in the area of the simulation-based BPO to achieve all objectives and overcome all challenges.
2 Introduction to simulation

Simulation is the process of designing a model of a real system and conducting experiments with this model for the purpose either of understanding the behaviour of the system or of evaluating various strategies (within the limits imposed by a criterion or set of criteria) for the operation of the system Shannon (1975)).

- What is the pass-through limit?
- What can be done to increase the limit?
- What restructuring would help the most?
- What is the impact of restructuring plan X?

• Mathematical models:
  – may be complex to design;
  – hard to understand for end-users.
• Real-life experiments may be:
  – expensive to implement;
  – take too long to implement;
  – has impact on the running system.

Business process simulation is arguably the most popular and most widely supported method for the quantitative analysis of process models. The basic idea behind the process modeling is quite simple. In fact, the process simulator generates a large number of hypothetical instances of the process, performs these instances step by step and records each step in this implementation. So, which of the available simulation software is the most appropriate software to be used?

To answer formulated questions, a comprehensive state-of-art review is needed for better understanding the current state of available simulation software. Therefore, this survey draws up a systematic review of simulation software.
2.1 Types of simulation

Simulation can be classified based on:

- **Results:**
  - ✓ Deterministic;
  - ✓ Stochastic.

- **Behavior:**
  - ✓ Discrete Event;
  - ✓ Continuous;
  - ✓ Agent-based.

*(Discrete and Continuous Simulation)*

A discrete simulation model has some variables whose values vary at discrete points in time *(Discrete and Continuous Simulation)*. Some examples of such models are:

- ✓ Bank tailoring systems
- ✓ Railway reservation systems
- ✓ Selling systems at counters in supermarkets
- ✓ Inventory control systems
- ✓ Manufacturing of discrete products

A continuous simulation model has variables that change continuously over time. Thus, the results of such systems are taken at fixed intervals of time after the system reaches a steady state *(Discrete and Continuous Simulation)*. Examples of such systems include:

- ✓ Production of chemicals
- ✓ Pipeline transmissions of gaseous products
Continuous simulation exemplary output

Discrete simulation exemplary output

Agent-based simulation exemplary output (Gong and M. Janssen 2010)
2.2 Steps of simulation

- Understand the system
- Set the goals
- Collect the data
- Decide on the model representation
- Develop the model
- Verify the model developed
- Validate the model
- Design the experiments
- Run and analyze the simulation model

For transient analysis, the initial state and the first part of the simulation are relevant. For steady-state analysis, the initial state and warm-up period are irrelevant and only the behavior after the warm-up period matters. Each graph shows one simulation run. The X-axis denotes time whereas the Y-axis represents the state of the process. For steady-state analysis one can take separate simulation runs (each with a warm-up period) or one large simulation run cut into smaller subruns (Business process simulation survival guide, van der Aalst, Wil).
Different simulation optimization approaches have been provided in the related papers, however evolutionary algorithms and in specific genetic algorithms are widely used for BPO.

Other names: “Simulation-based Optimization” or “Optimization via Simulation”.
3 Systematic review of simulation software

3.1. Research question

In this step, review questions are defined. So, this study was conducted to answer a research question as follows:

- **RQ1**: What are vendor and applications?
- **RQ2**: What is the technical compatibility?
- **RQ3**: How model building is realized?
- **RQ4**: What are the animation opportunities?
- **RQ5**: What are support and training possibilities?
- **RQ6**: What is the price of student version?

• New Simtalk, OPC UA and Siemens PLCSIM Advanced connections | N/A                                                                               |
| WITNESS                  | Free version available                | N/A                                               | N/A                                                                               |

The most simulation software vendors are providing similar functionalities to each other. However, the answer which simulation software is more applicable is depends on what is actually will be simulated and further optimized. For the business process optimization – very sophisticated simulation software must be chosen. It is because the human resources must be simulated in such processes. For the industry processes any of representing simulation software could be selected.

After the analysis of the answers to the research questions defined in section we pick up three simulation software to be tested in computer environment. They are: ANYLOGIC, SIMIO and WITNESS.
